SUMMARY

Detail-oriented Computer Science student with a strong foundation in Software Testing (SDLC/STLC) and Automation. Experienced in developing high-throughput Python applications and automating validation pipelines using CI/CD (GitHub Actions). Proficient in API testing, debugging, and ensuring system reliability through rigorous performance and edge-case analysis.

TECHNICAL SKILLS

Testing & QA: Manual Testing, Automation Testing, API Testing (Postman/FastAPI), SDLC, STLC, Bug Tracking, Unit Testing (PyTest), Performance Testing

Languages: Python, Java, SQL, JavaScript

Automation & DevOps: GitHub Actions (CI/CD), Docker, MLflow (Model Validation), Git, Linux (Bash Scripting)

Databases & Tools: MySQL, Redis, SQLite, Streamlit, AWS (EC2)

Core Concepts: Data Integrity, Error Handling, System Robustness, Neural Networks, Computer Vision

PROJECTS

Enterprise AI Copilot – System Validation & RAG Reliability

[🔗 Link](#)

Python, FastAPI, Redis, Docker, Performance Testing

Sep 2025 – Dec 2025

- Developed and validated a production-grade RAG system; conducted load testing to ensure sub-200ms retrieval latency for 1,000+ documents.
- Performed Integration Testing on modular FastAPI backends to ensure seamless communication between Redis memory and LLM APIs.
- Identified and resolved edge cases in information retrieval, achieving a Recall@10 accuracy of 92%.
- Set up health monitoring and containerized validation using Docker, ensuring 99.9% uptime during stress tests.

Financial Anomaly Detection – Automated Quality Pipeline

[🔗 Link](#)

Automation Testing, CI/CD, MLflow, GitHub Actions

March 2025 – June 2025

- Built an Automated Testing Deployment pipeline via GitHub Actions, reducing manual deployment and verification time by 40%.
- Utilized MLflow for Model Versioning Validation, ensuring zero regression errors during model updates (100% version control).
- Conducted Data Validation using SMOTE to handle imbalanced datasets, improving system reliability and F1-score to 0.89.
- Developed high-throughput processing tests to handle and validate 500+ transactions per second.

Automated E-Commerce Testing Framework

[🔗 Link](#)

Python, Selenium WebDriver, Pytest

Oct 2024 – Jan 2025

- Developed a robust end-to-end test automation framework for an e-commerce web application utilizing Python and Selenium WebDriver to validate critical user journeys securely.
- Implemented the Page Object Model (POM) design pattern, architecting highly maintainable and modular code by separating element locators and page interactions from the core test logic algorithms.
- Automated key business workflows including authentication and dynamic shopping cart fulfillment, integrating pytest-html to autonomously generate comprehensive graphical execution reports for QA stakeholder reviews.

EXPERIENCE & ACTIVITIES

- **Accenture Developer Simulation (Forage):** Completed a technical simulation covering STLC (Software Testing Life Cycle), SDLC, bug identification, and algorithmic debugging.
- **BlockDAG Hackathon 2025 (Round 2 Qualifier):** Built GhostWallet; focused on security testing and smart contract validation for secure decentralized transactions.
- **Open Source Contribution:** Active contributor to developer communities; engaged in code review, documentation, and optimizing code repositories for stability.

CERTIFICATIONS

- **Cyber Security Analyst** — IBM Career Education Program (2025)
- **OCI AI Foundations** — Oracle University (2025)
- **Generative AI using IBM Watsonx** — IBM Career Education Program (2025)
